Attempt : 1 Total Mark : 10 Marks Obtained : 10

Section 1: Coding

1. Problem Statement

Ravi is developing a student registration system for a college. To efficiently store and manage the student IDs, he decides to implement a doubly linked list where each node represents a student's ID.

In this system, each student's ID is stored sequentially, and the system needs to display all registered student IDs in the order they were entered.

Implement a program that creates a doubly linked list, inserts student IDs, and displays them in the same order.

Input Format

The first line contains an integer N the number of student IDs.

The second line contains N space-separated integers representing the student IDs.

Output Format

The output should display the single line containing N space-separated integers representing the student IDs stored in the doubly linked list.

Refer to the sample output for formatting specifications.

Sample Test Case

tail=nnode;

```
Input: 5
   10 20 30 40 50
Output: 10 20 30 40 50
   Answer
   #include<stdio.h>
   #include<stdlib.h>
   struct node{
     int id:
     struct node* prev;
     struct node*next;
   };
   struct node*head=NULL;
   struct node*tail=NULL;
   void insert(int id){
     struct node*nnode=(struct node*)malloc(sizeof(node));
      nnode->id=id;
      nnode->next=NULL;
     if(head==NULL){
        nnode->prev=NULL;
        head=nnode:
        tail=nnode;
      else{
        tail->next=nnode:
        nnode->prev=tail;
```

```
void display(){
    struct node*temp=head;
    while(temp!=NULL){
        printf("%d ",temp->id);
        temp=temp->next;
    }
    printf("\n");
}
int main(){
    int N, id;
    scanf("%d",&N);
    for(int i=0;i<N;i++){
        scanf("%d",&id);
        insert(id);
}
display();
    return 0;
}</pre>
```

Status: Correct Marks: 10/10
